SOFTWARE REQUIREMENTS SPECIFICATION

BUP Lost & Found System

Campus Recovery System for Bangladesh University of Professionals

1. Introduction

1.1 Purpose

This Software Requirements Specification (SRS) describes the functional and non-functional requirements of the BUP Lost & Found System, a web-based platform built for Bangladesh University of Professionals (BUP) to help students report, locate, and recover lost belongings on campus. This document is intended to serve as the single reference for the system's intended behaviour, guiding development, testing, and future maintenance.

1.2 Scope

The BUP Lost & Found System allows students to report items they have lost or found on campus, browse existing posts, and be matched with their belongings through an administrator-managed matching workflow. The system consists of:

- A public landing page with student/admin login and a browsable, login-free "All Posts" view.
- A student portal for reporting lost items (identity revealed) and found items (identity hidden, tracked by a token number).
- An administrator portal for reviewing posts by category, scoring potential matches automatically, and confirming returns.
- A searchable directory of all registered students, visible from the landing page.
- A notification system that informs a student when their lost item has been matched and returned.

The system does not handle physical item custody, payment processing, or integration with the university's official student information system in its current version — these are noted as future enhancements in Section 2.6.

1.3 Intended Audience

- Development team — as a reference for building and testing the system.
- Project supervisor / evaluators — to assess the completeness of the system against defined requirements.
- University administration — to understand the operational workflow before deployment.
- Future maintainers — to understand system scope when extending functionality.

1.4 Definitions, Acronyms, and Abbreviations

Term	Definition
BUP	Bangladesh University of Professionals
SRS	Software Requirements Specification
Admin	A user with administrative privileges who manages categories and confirms item returns
Token Number	A sequential identifier assigned to each found-item post, linking it privately to its finder
Match Score	A 0–100 numeric score computed by the system to estimate how likely a found item belongs to a specific lost-item report
JWT	JSON Web Token — used for authenticated session management
CRUD	Create, Read, Update, Delete — standard data operations

1.6 Overview

The remainder of this document is organized as follows: Section 2 provides an overall description of the product, its users, and the environment it operates in. Section 3 details the functional requirements grouped by module. Section 4 specifies the non-functional requirements the system must satisfy.
